1. Copyright and Usage Rights

Copyright © 2026 Nikke. All rights reserved.

Holy Presenter is a proprietary software application developed and owned by Nikke. All intellectual property rights, including but not limited to copyright, design, structure, and implementation, are the exclusive property of the creator. Unauthorized copying, reproduction, distribution, modification, or use of this software, in whole or in part, is strictly prohibited without prior written permission from the owner.

Holy Presenter is intended solely for a restricted and specifically authorized group of users. Access to and use of the application is granted only upon explicit approval by the owner. Any use of the software without such permission constitutes a violation of these terms and may result in legal consequences.

This software is not designed or intended for public distribution. Users are not permitted to share, publish, sublicense, reverse engineer, or otherwise make the software available to third parties without prior authorization. Any attempt to alter, adapt, or create derivative works based on Holy Presenter without permission is also prohibited.

Holy Presenter was created in 2026 by Nikke. Upon its creation, the work is automatically protected under applicable copyright laws. The owner retains full and exclusive authority to define the terms under which the software may be used, distributed, or modified.

If you intend to use, access, modify, or distribute Holy Presenter in any way not explicitly permitted, you must first obtain written consent from the creator and owner. Failure to comply with these requirements is considered a breach of intellectual property rights.

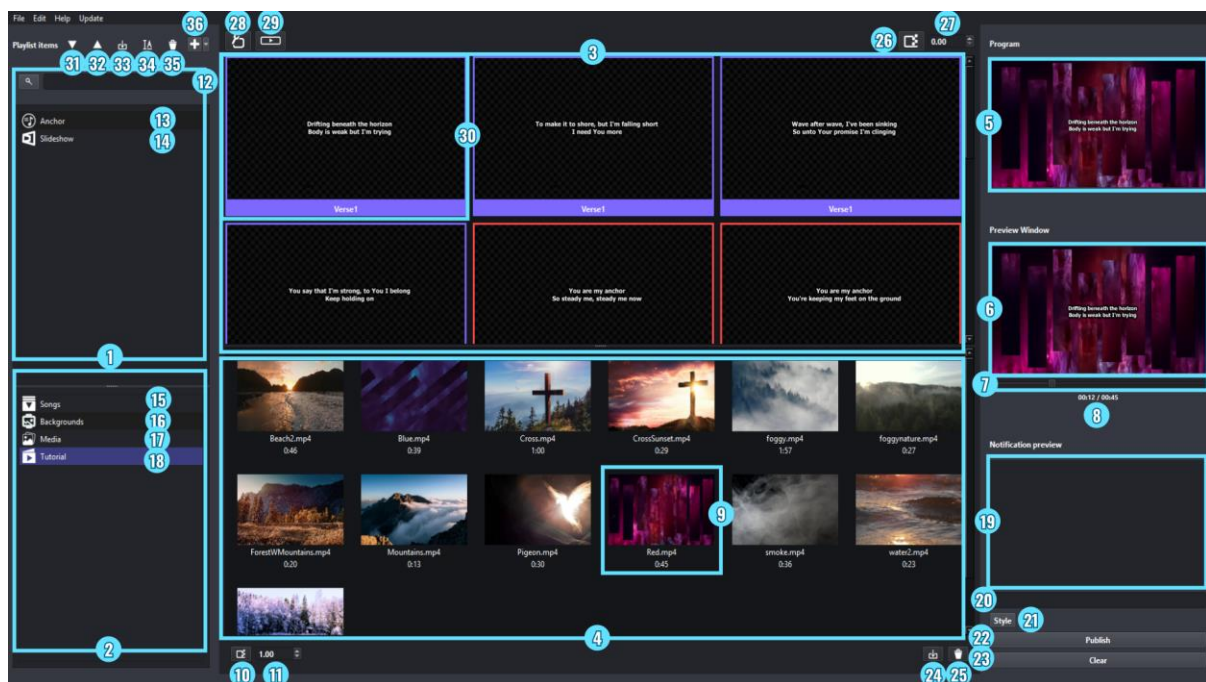

2. Overview

Holy Presenter is a software application designed for displaying song lyrics with backgrounds as well as presenting slideshow content. It enables users to manage and present multimedia content in a controlled and organized manner, making it suitable for live presentations and structured visual displays.

Main window

The main window of Holy Presenter is divided into three primary sections:

- **Playlists and System Panel** – for managing playlists, media, and other system elements
- **Content Panel** – for viewing and editing selected items
- **Presentation Panel** – for controlling and monitoring live output

Windows Version Interface

The Windows version of Holy Presenter consists of the following interface elements:

1. Item list of the selected playlist
2. Playlists and system resources panel
3. Slide view of the selected show
4. Media view
5. Program thumbnail (current live output)
6. Preview display
7. Background video control handle

- 8. Background video duration indicator
- 9. Background video item (with thumbnail, duration, and name)
- 10. Media fade toggle
- 11. Media fade duration control
- 12. Search bar for playlist items

Content Categories

- 13. Lyrics show
- 14. Slideshow
- 15. Songs playlist
- 16. Backgrounds
- 17. Media
- 18. Playlist

Notification Controls

- 19. Notification preview
- 20. Notification input field
- 21. Notification style button
- 22. Notification publish button
- 23. Notification delete button

Media and Item Management

- 24. Upload media
- 25. Delete media

Slide and Transition Controls

- 26. Slide fade toggle
- 27. Slide fade duration

Editing and Presentation

- 28. Editor
- 29. Live mode
- 30. Slide

Item Management Controls

- 31. Move item down
- 32. Move item up
- 33. Upload
- 34. Rename selected item
- 35. Remove selected item
- 36. New item

Editor Window

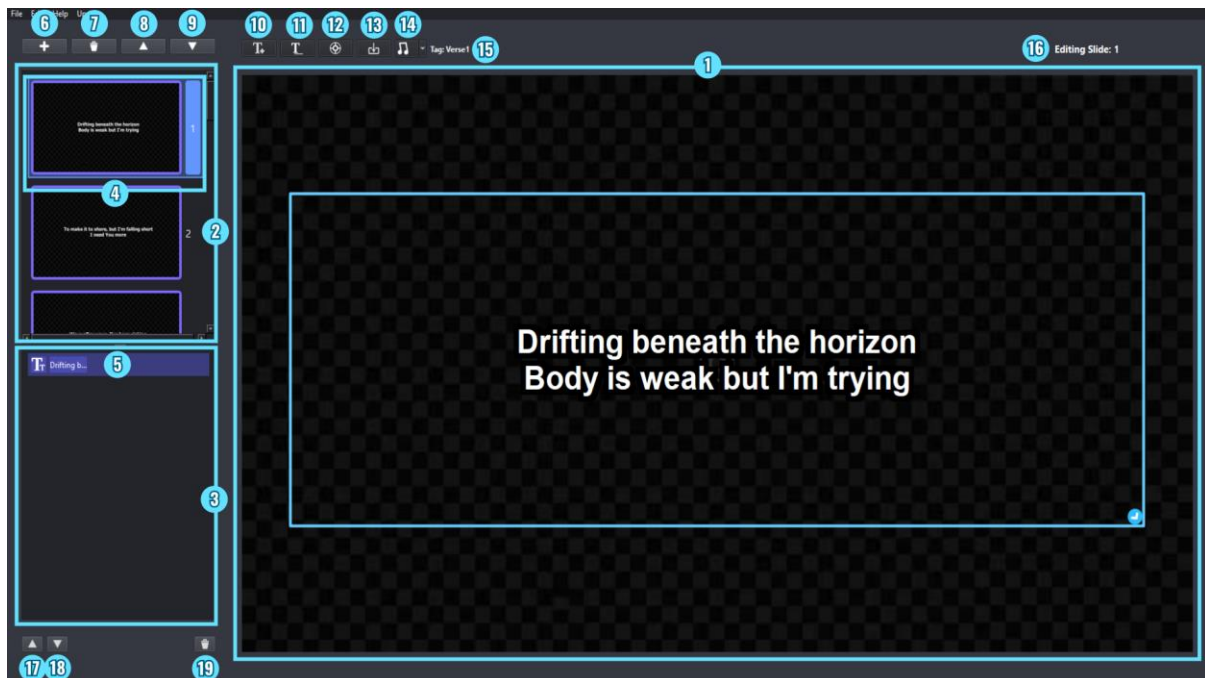

The Editor is used to modify the slides of the selected slideshow or lyrics show. It provides a structured environment for editing both the content and layout of slides.

The Editor interface is divided into three primary panels:

- **Slides List Panel** – displays all slides within the current show and allows navigation and ordering
- **Elements List Panel** – displays all elements contained within the selected slide
- **Slide Editor Panel** – provides a visual workspace for editing the selected slide

Slideshows support multiple elements within a single slide, allowing for flexible content composition, such as combining text, images, and other media elements.

In contrast, a lyrics show is restricted to exactly one text element per slide. This limitation ensures consistency and clarity when displaying song lyrics.

Windows Version Interface

The Slide Editor provides tools for creating, organizing, and modifying slides and their individual elements. The interface consists of the following components:

1. Preview editing view of the selected slide
2. Slides list
3. Elements list of the selected slide
4. Slide workspace
5. Slide element

Slide Management Controls

6. Add slide
7. Delete slide
8. Move slide up
9. Move slide down

Element Controls

10. Add text element
11. Rename text within the selected text element
12. Center selected element

Additional Features

13. Upload image
14. Assign a tag to the selected slide
15. Slide tag indicator
16. Selected slide and edit mode indicator

3. System Overview

The Holy Presenter system is composed of multiple interconnected components that manage content, media, and presentation output. Each component serves a specific purpose within the workflow of creating and delivering presentations.

1. Playlists

Playlists function as content libraries that can contain both slideshows and lyrics shows. Each playlist maintains its own independent set of items.

Playlists can be renamed and reordered as needed. New playlists can be created by opening the “**New...**” menu (located among the buttons in the upper-left corner of the main window) and selecting “New Playlist”, or by using the designated shortcut.

Items within a playlist can be moved, removed, or imported from other sources. Playlists are particularly useful for organizing all required content for a specific event or presentation.

2. Songs

The Songs library functions similarly to playlists, but it is restricted to containing only lyrics show objects.

Unlike standard playlists, items are not directly moved into or out of the Songs library. Instead, a copy is created whenever an item is transferred between a playlist and the Songs library.

The Songs library is a system-defined component and cannot be renamed or deleted. It serves as a centralized and extensive repository for lyrics shows, allowing users to store and easily reuse song content across multiple playlists.

3. Slideshow and Lyrics Show

Slideshows and lyrics shows are presentation objects composed of a collection of slides. Slides can contain text elements and images, which are managed through the Editor.

Despite their similarities, the two types differ in functionality:

Slideshow:

Supports both text and image elements with no structural limitations within the editor. Slideshows cannot be added to the Songs library.

Lyrics**Show:**

Each slide contains exactly one text element, with no additional elements allowed. Lyrics shows can be added to the Songs library.

New slideshows and lyrics shows can be created via the “New...” menu (located in the upper-left corner of the main window) by selecting “New Slideshow” or “New Lyrics Show”, or by using the appropriate shortcut.

4. Backgrounds

The Backgrounds gallery consists of background videos that play in a continuous loop on the output channels (Preview and Program). These videos are rendered behind slides from slideshows and lyrics shows.

Background videos can be added using the Upload Backgrounds button (located in the lower-right corner of the main window), provided that the media meets the supported aspect ratio requirements. It is recommended that background videos are designed to loop seamlessly.

Background videos support fade transitions.

Supported resolutions:

3840 × 2160

1920 × 1080

1280 × 720

960 × 540

640 × 360

5. Media

The Media library functions similarly to the Backgrounds gallery but supports both images and videos.

Media files can be added using the Upload button (located in the upper-left corner of the main window). These assets can then be used within slides.

Media elements support fade transitions.

6. Slide

A slide is an individual unit within a slideshow or lyrics show. Slides can contain text and/or image elements depending on the type of show.

A slide can be sent to the output channels (Preview and Program) by selecting it. Slides are always rendered above background videos in the output.

Slides support fade transitions.

7. Preview, Program, and LyricsMask

Holy Presenter includes three output channels: Preview, Program, and LyricsMask.

Preview:

Always active and displays what would be shown on the main output if live mode were enabled.

Program:

Activated by pressing the Play button, which enables live mode. Pressing the Play button again disables live mode.

The Program output includes both a thumbnail (visible in the main window above the Preview) and a separate window, which can be moved to an external display such as a projector or secondary monitor. Automatic window placement can be configured in the settings.

LyricsMask:

Activated when live mode is enabled and when the feature is turned on in the settings. LyricsMask is a separate window displaying only the text elements of lyrics show slides, using a user-defined color and positioning. This output can be used, for example, with external video systems such as ATEM for keying (upstream or downstream).

8. Message

The Message feature is an overlay function that allows important or urgent information to be displayed on top of all content in the Program output.

The message text can be edited, although it supports only a limited amount of text. Users can also configure the style and position of the message within the Program window.

A preview of the message is shown in its own preview area located below the main Preview display. The message is sent to the Program output by pressing the Publish button and can be removed by pressing the Clear button.

9. Editor

The Editor serves as the central workspace for creating, editing, and managing the selected slideshow or lyrics show. It provides tools for slide creation, content modification, and structural organization.

To create new slides, use the **“Add Slide”** button (identified by a plus icon). Slides can be removed using the **Delete** button located within the same control bar. Slides may also be reordered using the available sorting controls.

Slide Editing Functions

Within a slide, the following editing operations are available:

- **Text** **Element:**
Add new text elements to the slide.
- **Image** **Element:**
Add new image elements to the slide.
- **Center** **Element:**
Align the selected element to the center of the slide.
- **Rename** **Text** **Element:**
Modify the text content of the selected text element.
- **Move** **Element** **Down:**
Change the layering order by moving the selected element backward.
- **Move** **Element** **Up:**
Change the layering order by moving the selected element forward.
- **Delete** **Element:**
Remove the selected element from the slide.
- **Tags:**
Assign a tag to the slide for organizational purposes.

Lyrics Show vs. Slideshow

A lyrics show has stricter limitations compared to a standard slideshow.

In a lyrics show:

- Each slide contains exactly one text element
- The text element cannot be removed
- No additional elements can be added

These constraints ensure consistent formatting and readability when displaying lyrics.

Tags

Slides can be assigned tags to improve organization and structure. Tags help users group and identify slides more efficiently.

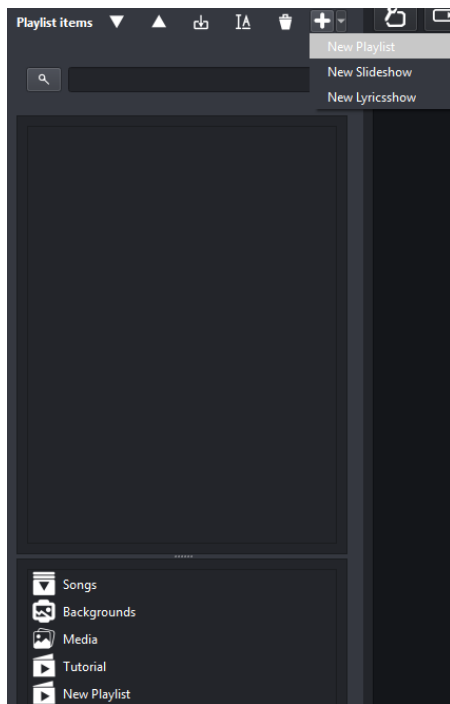

Each tag is associated with a specific color, allowing slides to be visually distinguished from one another at a glance.

4. Tutorials

1. Creating a Simple Lyrics Show for the Songs Library

To begin, create a new playlist by clicking the **“New...”** button (plus icon) and selecting **“New Playlist.”**

The newly created playlist will appear in the lower section of the left panel.

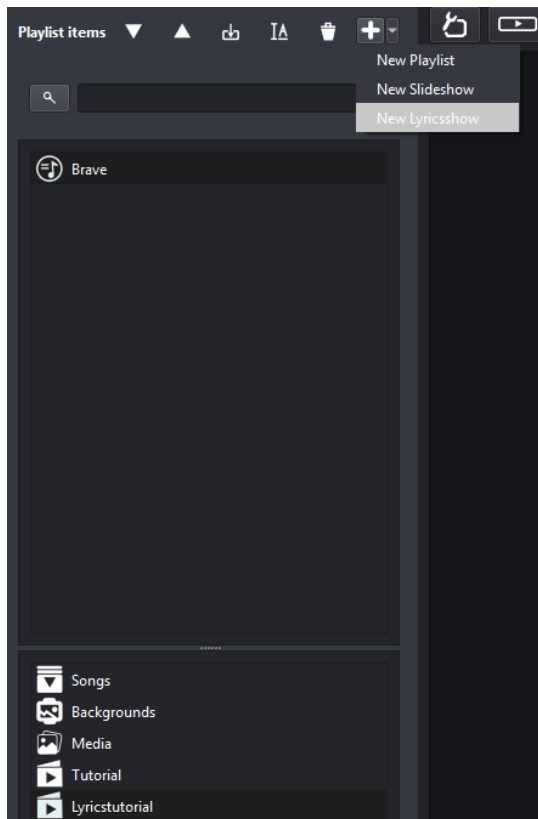

You may rename the playlist if desired. For this tutorial, rename it to **“Lyricstutorial”** by selecting the playlist and clicking the **Rename** button located in the top toolbar.

Once the playlist has been created and renamed, proceed to add new lyrics show. Select the **“Lyricstutorial”** playlist, click the **“New...”** button again, and choose **“New Lyrics Show.”**

A new lyrics show will now appear inside the selected playlist.

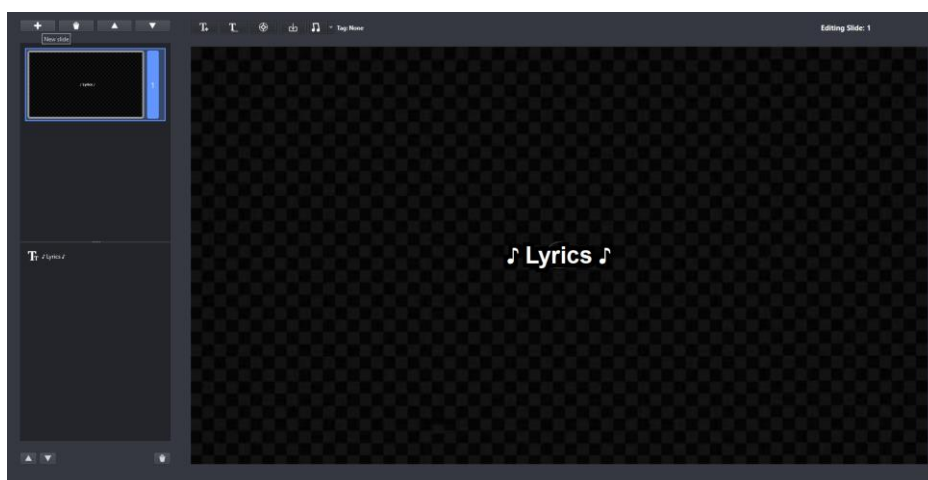

Rename the lyrics show to match the song title. In this example, we will create lyrics for the song *“Brave”* by Skillet, so rename the lyrics show to **“Brave.”** It is recommended to always name lyrics shows according to the song title to ensure easy identification later within the Songs library.

Next, open the lyrics show in the Editor by clicking the **Editor** button (tool icon). The Editor will initially be empty, but slides containing lyrics will be added shortly.

Create a new slide by clicking the “**Add Slide**” button (plus icon). In a lyrics show, a text element is automatically created for each new slide.

Select the slide from the slides list to open it in the workspace on the right. By clicking the text element, you can move and resize it. Adjust the element as needed, but it is recommended to position and scale the text so that it remains clearly visible and centered.

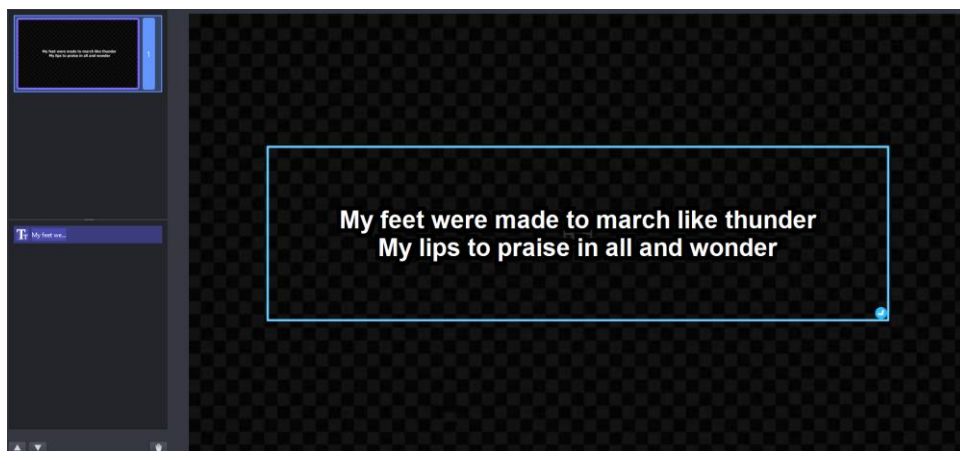

To edit the text content, click the **“Rename Text Element”** button. You can then paste lyrics into the text field using:

- **Ctrl + V** (Windows)
- **Cmd + V** (macOS)

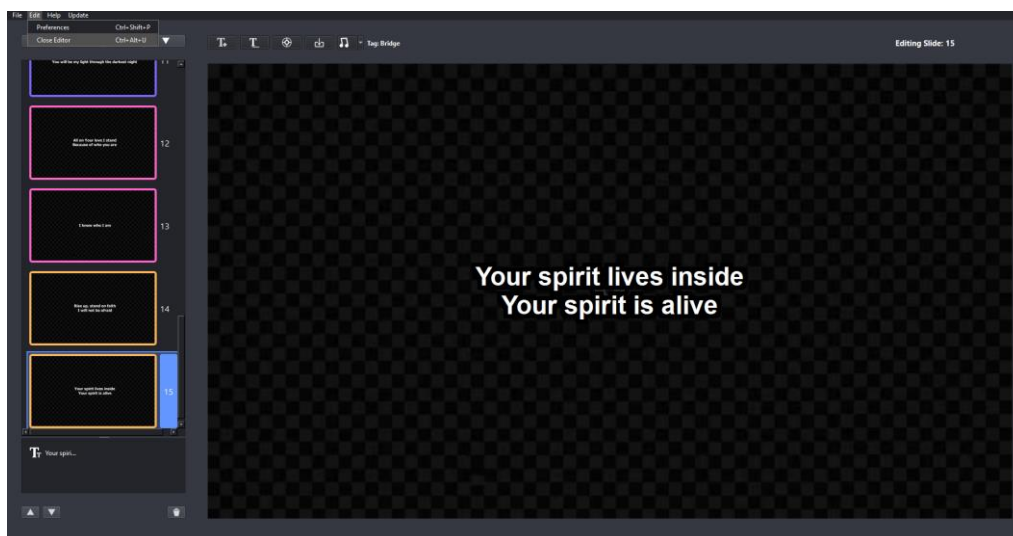

For optimal readability, it is recommended to use a maximum of three lines per slide, with two lines generally providing the best results.

After entering the text, assign a tag to the slide. For example, if the lyrics belong to the first verse, assign the tag **“Verse 1.”** The slide will then be visually marked (e.g., with a colored outline) to indicate its tag.

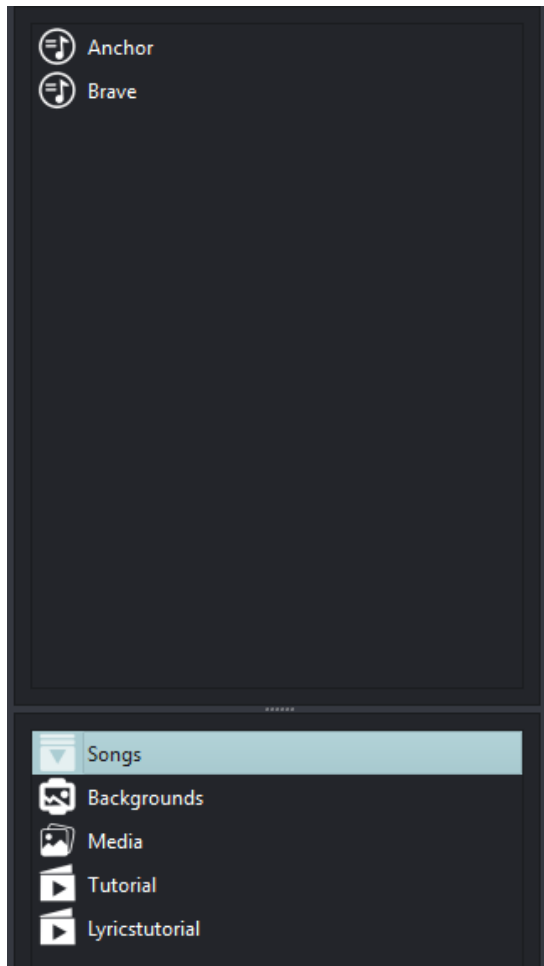

Repeat this process to create additional slides for the entire song, assigning appropriate tags based on the song structure (e.g., Verse, Chorus, Bridge).

Once all slides have been created, exit the Editor by selecting **“Close Editor”** from the top menu.

You now have a complete lyrics show. To store it in the Songs library, drag and drop the lyrics show from the playlist into the Songs list.

The song “**Brave**” is now available in the Songs library and can be easily copied into any playlist when needed.

2. Displaying Lyrics via ATEM

Before proceeding, it is recommended to familiarize yourself with the operation of **ATEM Software Control** and ensure that all required hardware and connections are functioning correctly.

HolyPresenter supports outputting lyrics as a mask overlay, allowing text to be displayed on top of video content (for example, enabling viewers to sing along).

Setup Requirements

Ensure that:

- An **ATEM Television Studio** device is available
- A free HDMI input is available on the ATEM device
- A computer with Holy Presenter installed is ready

Connect the computer to the ATEM using an HDMI cable. After connecting, configure your display settings to **Extend** mode (not duplicate), so that multiple independent windows can be used.

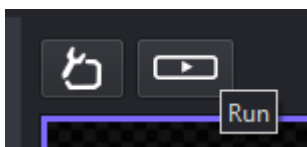

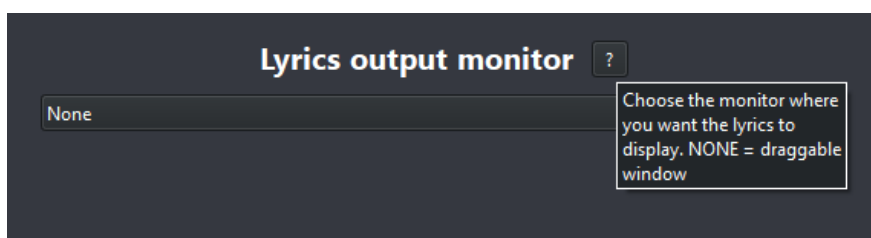

Configuring Output

Verify that two separate display windows are available, and that one of them is routed to the ATEM input. This connection should appear as a new source within ATEM.

In Holy Presenter settings:

- Assign the ATEM-connected display as the **Lyrics Output Monitor**
- If the display is not detected, restart Holy Presenter and reconnect the HDMI cable if necessary

Ensure that the Lyrics window is enabled in the settings. Activate it by pressing the **Play** button (Run) in Holy Presenter to enter live mode.

ATEM Configuration

Once the output is visible:

1. Open **ATEM Software Control**
2. Navigate to the right-side panel and select either:
 - a. **Upstream Key**, or
 - b. **Downstream Key**

It is recommended to use **Downstream Key**, as it is more suitable for persistent overlays such as lyrics.

3. Set both:
 - a. **Fill Source**
 - b. **Key**

Source

to the Lyrics output window
4. Enable the key by pressing “**On Air**”

If the lyrics window appears, proceed to remove the background:

- Use **Chroma Key** settings (in Upstream Key, if used)
- Select the background color used in the LyricsMask window
- Adjust settings until only the text remains visible

At this point, the lyrics should appear correctly over the video feed.

If issues occur, it is recommended to further review ATEM functionality and consult tutorials related to **Upstream Key** and **Downstream Key** configuration.
